Business Continuity Policy

Internal policy document | *Confidential*

1. Continuity Planning

Each business unit must maintain a continuity plan for critical services, key personnel, essential records, and technology dependencies. Plans must identify recovery priorities, delegated decision authority, and alternate operating procedures.

Plan owners must review their continuity documentation at least annually and whenever a material process, system, or supplier changes. Business unit leaders are accountable for confirming that assigned recovery roles remain current.

2. Testing and Recovery

Critical service recovery procedures must be exercised at least once each calendar year. Exercises may use a tabletop scenario or a technical recovery test appropriate to the service risk.

Exercise results, identified gaps, and corrective action owners must be recorded in the continuity register. During a disruption, the incident commander coordinates restoration priorities with business unit leaders.
